

RUNDGÅNG

Welcome to Rundgång. The feedback platform that accompanies you on new sonic adventures. The idea is simple, a pickup, a gain stage and EQ, followed by a speaker. The setup is fairly flexible, so you can route the signal in and out through the different blocks as you like. The aux inputs are parallel to the pickup. The spkr in is normalised, so it will break the connection from the pickup and aux inputs.

A warning: The output volume and feedback created can be high pitched and violent. So protect your ears and take precautions to make sure you don't damage your hearing.

To get started install stand offs in the desired mounting points, place a (magnetic) material on top of the stand offs. Tweak the knobs until some sort of sound is produced. The Rundgång comes with a metal sheet and some screws to get you started. But it's recommended to let your fantasy go wild. Place anything and everything on top of it and see what happens. Put guitar pedals in the loop. Run external sound through it with the sheet on for reverb effects. Excitation elements can be placed on top of objects for additional chaos. Experiment!

Please enjoy.
